Education

Tehran Institute for Advanced Studies (TeIAS), Khatam University	2021 – 2024
M.Sc. in Economics	Tehran, Iran
Shahid Bahonar University of Kerman	2015 – 2020
B.Sc. in Electrical Engineering	Kerman, Iran

Research Interests

Banking, Sustainable Finance, Environmental Economics.

Working Papers

Relationship Banking: Borrower's Incentive Channel

with *Pejman Abedifar, Steven Ongena, Amine Tarazi*

(*R&R — Journal of Corporate Finance*)

Abstract: What is the impact of a prior banking relationship on a borrower's incentives to avoid default? To answer this question, we exploit a unique institutional setting and data on 149,230 mortgage loans tracked for twenty four months. We find that the presence of a relationship diminishes borrower's default risk by approximately 4%, attributable exclusively to the value of the relationship for the borrower. This effect persists during the notable surge in loan defaults during COVID-19 and is even more pronounced for borrowers affected by a natural disaster, as well as among wealthier, more religious, and male borrowers.

Climate Change and Agricultural Adaptations: Insights on Crop Choices and Irrigation Shifts

with *Layla Shiva*

(*R&R — Journal of Agricultural Economics*)

Abstract: Given their geographic location and vulnerable agricultural sector, countries in the Middle East have consistently regarded hydro-climatic conditions as a critical and enduring concern. This paper evaluates the potential changes in agricultural productivity across Iran's counties due to climate change and examines the benefits of implementing agricultural adaptations. Additionally, this research examines the main adaptations patterns — shifting among water sources for irrigation and crop substitution in response to climate change. Employing a unique 20-year panel dataset at county level, we exhibit that the adoption of agricultural adaptations significantly enhances the productivity up to US\$3,351,067, which is about 91.1% of the total agricultural rent in Iran, compared to the not adapted agriculture in all climate zones, based on the projected end-of-century analysis. Finally, the results also show that the utilization of deep and semi-deep wells for irrigation have increased all over Iran when temperature increases, while the share of river, canal, and aqueduct have decreased significantly. We also found that more heat-resistant crop such as maize has been planted on more lands compared to less heat-tolerant crop, especially in warmer regions.

Work in Progress

Corporate Biodiversity Footprints under Climate Change Regulations

with *Pejman Abedifar and Steven Ongena*

Abstract: Climate change and biodiversity loss are pressing global challenges, both threatening ecosystems, human well-being, and economic stability. While climate regulations (e.g., Paris Agreement, EU Green Deal, U.S. Clean Energy Standard) aim to mitigate carbon emissions, their unintended consequences for biodiversity have received limited attention. Firms' behavioral responses — such as adopting new technologies, relocating operations, or changing supply chains — may either mitigate or exacerbate biodiversity loss. Understanding these trade-offs is crucial to designing regulations that align climate and biodiversity goals. This study investigates how climate change regulations aimed at reduction of carbon emission influence firms' biodiversity impacts across four channels: land use, greenhouse gases emissions, water pollution, and air pollution.

Conferences

European Economic Association (*Bordeaux School of Economics, 2025*)

European Financial Management Association (*The American College of Greece, 2025*)

World Finance Banking Symposium (*Abu Dhabi School of Management, 2024*)

International Conference on Finance, Accounting, and Banking (*University of Southampton, 2024*)

EAERE Annual Conference (*KU Lueven, 2024*)

Awards & Honors

TeIAS Exceptional Talent Master's Full Scholarship (2021)

Ranked 91th among 10,000 Participants

Nationwide Graduate University Entrance Exam of Economics (2021)

Ranked 5th

Nationwide Economics Olympiad (2020)

Programming Skills

R, Stata, Python, QGIS, ArcGIS, Matlab
